

## Project Progress Report 1

### My Contribution:

I have successfully created the index page which is the homepage of our project. I have learned how to include external PHP files using ``include()`` to maintain a consistent header and footer throughout the website. This demonstrates my ability to modularize code for better maintenance. I have learned how to dynamically set background images using PHP, allowing me to customize the visual appeal of the homepage. I have used PHP to dynamically style elements, such as changing colours, fonts on layouts based on certain conditions or user interactions. I have used PHP not only for header but also for other common elements like navigation menus or footer sections, ensuring a consistent user experience.

### Summary:

We as a Team completed coding for the homepage, Admin login page and started working on User Interface and its Modules along with Admin Modules. We also created the database for storing car details, We also created a table to store new Users registration details, There is a table for storing Admin Details.
